PHASE 04 / BACKEND AND USER SERVICES

Backend and user services

Build API routes that validate input, manage accounts safely, and return consistent plan data.

Activities

Implement `POST /api/generate-home` and `POST /api/generate-party` with typed JSON request models.

Implement `POST /api/generate-jewelry` as multipart form data with an optional JPEG, PNG, or WebP upload capped at 5 MB.

Implement registration, login, and logout with PBKDF2 password hashing and an HTTP-only signed session cookie.

Store signed-in users' requests and responses in SQLite; leave guest plans usable without attaching them to an account.

Protect history and recommendation-detail lookups so users can only read their own saved plans.

Phase outputs

Acceptance checks

Valid inputs return the documented response shape; invalid values return useful 4xx errors.

Passwords are never stored in plain text.

Unauthenticated history is rejected and one user cannot retrieve another user's saved record.
