PHASE 07 / VERIFICATION AND REFINEMENT

Verification and refinement

Check expected behavior and failure paths before handing the app to another person.

Activities

Check `/health`, the landing page, and generated OpenAPI documentation at `/docs`.

Submit realistic budgets to all planners with Gemini disabled; verify fallback output and budget totals.

Test registration, login, logout, session metadata, history access, and record ownership.

Try empty room selections, zero/negative budgets, extreme guest counts, invalid currencies, unsupported image types, and oversized uploads.

With a valid Gemini key, verify text-only and image-plus-text responses; simulate or inspect fallback behavior for timeouts and invalid output.

Phase outputs

Acceptance checks

Every critical route behaves as expected in a clean local environment.

Planner totals stay within the stated cap across normal and edge inputs.

User-facing errors are actionable and do not disclose secrets.
